November 7, 2026

Dear Editors,

We are pleased to submit our manuscript, "HARK: Human-Accountable, Authority-Typed Review Knowledge for Evidence-Bearing Document Review," for consideration in *Computers*.

The manuscript presents an executable architecture for rule-governed document review that combines rule-specific operational authority, source-located evidence, explicit pending outcomes, and recorded human disposition. On a fixed corpus of 2,000 technical proposals containing 5,323 planted defects, the combined configuration achieves micro-F1 0.746, compared with 0.205 for the keyword baseline, and 75.4% agreement with policy-derived verdicts. The study also analyses evidence-gate acceptance and unresolved review workload, and specifies deployment contracts for authenticated approval, comprehensive authority control, and configuration recovery.

We believe the work will interest readers in human-centred artificial intelligence, neuro-symbolic systems, document intelligence, and dependable review workflows. The manuscript distinguishes the evaluated prototype from deployment-level requirements and positions HARK as a regression-tested review aid rather than an autonomous decision system. The rule package, evaluation scripts, and released evaluation materials are available through the repository and archived release reported in the manuscript.

This manuscript is original, has not been published previously, and is not under consideration by another journal. All authors have approved the manuscript and its submission to *Computers*.

Thank you for considering our work.

Sincerely,

Zhitong Yang
